INTRODUCTION

INTRODUCTION

The South Dakota population projections were last updated by the State Data Center (the Federal State Cooperative for Population Projections member) in a 1985 publication entitled South Dakota Population Projections 1985 - 2005. The goals of the 1985 population projections were threefold. The first goal was to provide South Dakota state agencies with a uniform set of projections for South Dakota and its counties. The second goal was to update the State Planning Bureau projections which were released in February 1980 and to update each subsequent set of projections on the basis of at least two times per decade. The third goal was to prepare the projection methodology for use on a personal micro computer. Each of these goals has been achieved. This publication contains population projections that revise the 1985 publication.

This series of population projections is consistent by method with the South Dakota Population Projections 1985 - 2005. The demographically acceptable cohort-component method of projecting population remains in use. The assumptions for fertility, mortality and migration have been updated and revised since the 1985 publication. The assumptions are based on current secondary data sources and the recommendations from a meeting held in November 1987. Appendix A contains a description of the methodology and assumptions implemented in this projection series.

The November 1987 meeting was attended by representatives from the Departments of Health, Labor, Social Services and Transportation, as well as the Governor's Office of Economic Development and the State Data Center (SDC). The primary objective of this meeting was to derive input from various areas of expertise and generate consensus on the fertility, mortality, migration and base year assumptions to be utilzed in updating the 1985 population projections for South Dakota.

This report contains text (this introduction, highlights and the appendix), two maps, graphs, a table of contents and four tables. The highlights section and graphs provide an overview and summary of the projections. The four tables contain the population projections to the year 2010 in various formats with different levels of detail.

Research on fertility, mortality and migration trends and computation of the projections were performed by Lee A. Mahlen, State Data Center demographer.

The following state agencies financially contributed to the projection project: Department of Health, Department of Labor, Department of Social Services, Department of Transportation, South Dakota Lottery and the Governor's Office of Economic Development. The State Data Center would like to thank these agencies for their valuable input, patience and financial contributions.

HIGHLIGHTS

PROJECTION HIGHLIGHTS: MEDIUM SERIES

The total population of South Dakota is projected to increase by 10.5 percent to 763,291 by the year 2010 in comparison to the 1980 population of 690,768.

The 0 to 19 age population is projected to account for 27.7 percent of the 2010 population as oppossed to 33.9 percent of the 1980 population. This is a decrease of 9.8 percent or 23,036 people from its respective 1980 population of 234,358.

The 20 to 44 age group is projected to increase a modest .4 percent or 851 persons by the year 2010. This age group is projected to account for the largest percentage of the 2010 population with 31.0 percent or 236,663 residents.

The 45 to 64 age group is projected to increase 49.9 percent by the year 2010 in comparison to the 1980 population of 129,579; an increase of 64,719 people to a total projected population of 194,298 for this age group. By far the largest growing segment of the projected population in terms of raw numbers and percentage increase.

The 65 and over age group is projected to comprise 15.9 percent or 121,009 of the 2010 population. This represents an increase of 32.9 percent from the 1980 population of 91,019.

The State will continue to experience net out-migration through the year 2010.

The median age of the projected population will rise from 28.8 in 1980 to 36.9 by the year 2010.

Minnehaha County will continue to dominate the proportion of State residents with 165,271 residents or 21.7 percent of the projected 2010 State population.

Planning Districts I, II, and VI are projected to increase in population by 2010 while Planning Districts III, IV, and V are projected to decrease in population by 2010.

The State is projected to have seventeen counties increasing in population by 2010 as oppossed to 49 counties decreasing in population.

APPENDIX A

METHODOLOGY

INTRODUCTION

A meeting was conducted in November 1987 with representatives from the Departments of Health, Labor, Social Services and Transportation as well as the Governor's Office of Economic Development and the State Data Center (SDC). The primary objective of this meeting was to derive input from various areas of expertise and generate consensus on the fertility, mortality, migration and base year assumptions to be utilized in updating the South Dakota population projections.

The cohort-component projection model derived by Donald B. Pittenger, PhD., was utilized in generating the South Dakota population projections. This method was chosen primarily because it employs the fundamental components of change: fertility, migration and mortality. These components of change tell us what demographic processes shape the past and future growth of the population.

Dr. Pittenger discusses the application of this method to county areas in his book Projecting State and Local Populations, Ballinger Publishing Company, 1976. Furthermore, each of the fundamental components of change was analyzed with techniques developed by Henry S. Shryock and Jacob S. Siegel, in their book Methods and Materials of Demography, Bureau of the Census, Department of Commerce, June 1980.

Population projections represent mathematical extrapolations of future events based upon certain underlying assumptions. By definition, projections are correct because they represent the future population if and only if the underlying assumptions are accurate. The future population cannot be predicted exactly; however, changes in assumptions will have less impact at the state than the county level. Fundamental assumptions are that no war or natural disaster will occur, nor will there be a major catastrophe that would drastically affect the projections.

The following sections describe the population assumptions for each component in the projections.

FERTILITY

Age-specific fertility rates (ASFRs) were analyzed using two sets of assumptions based on the recommendations from the November 1987 meeting. The first set of assumptions contained the following crude birth rates (CBRs): 15.0 live births per 1,000 population in 1990, 15.5 in 1995 and 16.0 thereafter. The second set of assumptions comprises higher CBRs: 15.5 in 1990, 16.0 in 1995 and 16.5 thereafter.

The second set of assumptions were utilized after substantial review, because a CBR of 15.0 in 1990 appeared low compared to past state data. Review of historical South Dakota CBRs revealed only one year, 1973, in which the crude birth rate fell below 16.0. Analysis of several factors, both

state and national, also assisted in guiding these fertility assumptions. Updates and review were conducted on the urban/rural population mix, patterns and duration of marriage, survival of females to child-bearing age, employment of women outside the home, CBRs and ASFRs.

The State CBR assumptions were used as guidelines for county totals. Counties with CBRs exceeding 20.0 in consecutive years from 1980 to 1986 had county age specific fertility rates calculated due to their unique fertility patterns. These counties include: Bennett, Buffalo, Corson, Dewey, Pennington, Shannon, Todd and Ziebach.

MORTALITY

Mortality rates generated by the State Data Center (SDC) were obtained using 1984 to 1986 mortality experience of the State. Cohort-specific mortality rates (population in five year age groupings by sex) were calculated using an average of three years mortality, to smooth for variation, divided by the 1985 population.

Cohort-specific survival rates were derived by subtracting each cohort-specific mortality rate from one. These survival rates were converted from single year survival probabilities to five year survival probabilities utilizing the Reed-Merrill conversion table.

The five year probabilities were projected following the improvement of trends in South Dakota and the United States.

This was accomplished by trending in relation to improvements in the National middle survival assumptions developed by the Census Bureau. These converted State survival probabilities are used as quidelines for county rates. Counties with unique mortality experience were adjusted separately. Analysis of the most recent mortality by five-year age cohorts by sex identified the following counties for adjustment: Edmunds, Fall River, Hamlin, Hand, Hutchinson, Kingsbury, McPherson, Marshall, Shannon and Todd.

MIGRATION

State Data Center migration assumptions consist of three series of projections (high, medium and low). The migration rates for each series were divided into two time frames: 1980 to 1995 and 1995 to 2005.

Migration data from numerous sources were utilized in identifying past migration trends and projecting future migration patterns. The 1980 to 1995 time frame was constructed utilizing the 1980 Census question: Where did this person live five years ago? Additionally, 1983-1984 and 1984-1985 Internal Revenue Service (IRS) data and 1985 Census Bureau population residuals from 1980-1985 identified more recent migration trends. This data was used to generate the migration assumptions for the 1995 to 2005 time frame.

The Census Bureau migration data detailed migration by age group, county and state. The IRS migration data estimated

state and county migration patterns. State and county migration rates by age group were calculated using the 1980 Census Bureau migration data. Adjustments to these rates were made if IRS data and 1985 Census Bureau residuals indicated a significant reversal in the state or county migration patterns from those of the 1980 census data.

In addition to middle series projections, a high and low series were generated. The low series assumes higher out-migration and was adjusted from the middle series migration assumptions as follows: .0025 more out-migration for ages 0 - 24; .01 more out-migration for ages 25 - 64; and .015 more out-migration for ages 65 +. The result of the low series is decreased population projections. In contrast, the high series assumes less out-migration and adjustments in comparison to the middle series were made as follows: +.01 to ages 0 - 24; +.0025 to ages 25 - 64; and +.0005 to ages 65 +. The result of the high series is increased population projections.

These adjustments were made on the basis of providing a reasonable range from the middle series. An analysis of the middle series population projections revealed possible under or over counts in the population projections. This review formed the basis for which age cohorts to adjust their respective migration rates and to what degree.
